Jhon Raven P. Cadiz

Web Developer (Full-Stack) | React, Next.js, Node.js & AI-Assisted Development

Manila, Philippines | Open to remote | +639935298842 | jhonravencadiz02@gmail.com
Portfolio: https://jhonraven.vercel.app | GitHub: https://github.com/Rav-alt

SUMMARY

Web developer with full-stack experience building production real-estate platforms at Grid Property Ventures. Built the first front end of GRID's sales website, integrated it with the GRID user platform, shipped the Plans & Pricing redesign, and raised the platform's Lighthouse performance score from 42 to 79. Skilled in React, Next.js and TypeScript on the front end and Node.js, Express and MongoDB on the back end. Builds AI-powered products (Gemini API) and uses agentic coding workflows to ship faster. Background in QA testing and React Native mobile development.

SKILLS

Front End: React 19, Next.js (App Router), TypeScript, JavaScript (ES6+), HTML, CSS, Tailwind CSS, shadcn/ui, Radix UI, TanStack React Query, Vite, Motion, Leaflet

Back End: Node.js, Express, Next.js API routes, REST APIs, GraphQL (GitHub API), MongoDB / Mongoose, Supabase, JWT & Google OAuth, Zod

Mobile & Desktop: React Native, Expo, Tauri 2, Rust, Win32 APIs

AI & Agentic Development: Google Gemini API (structured JSON output), LLM integration with validation & fallbacks, prompt engineering, AI-assisted development / agentic coding (Claude Code)

Testing & QA: Vitest, Playwright, test-driven development, manual testing, test case writing, regression testing, UAT, bug tracking

Tools & Platforms: Git, GitHub, Figma, Vercel, Firebase, Postman, Google Sheets/Docs, Excel

Data: GTFS transit data, geocoding (OpenStreetMap Nominatim), PokéAPI

EXPERIENCE

Frontend Developer

Grid Property Ventures | June 2026 - September 2026

- Built the first front end of GRID's sales website from the ground up and continued to maintain and extend it.
- Integrated the GRID sales platform with the GRID user platform through a shared API and database: buyer/seller forms submitted by the sales team published automatically to the user platform with their full details and metadata, so users could browse posted buyer listings.
- Improved the GRID platform's web performance, raising the Lighthouse Performance score from 42 to 79 and cutting Speed Index from 6.5 s to 2.2 s (about 66% faster).
- Implemented the redesign of the Plans & Pricing experience and shipped it to production.
- Developed and maintained the customer-facing web app and internal admin console using React, TypeScript and Next.js.
- Turned Figma designs into responsive, reusable UI and shipped features from design to production.
- Worked across the full stack, building and integrating backend APIs with Node.js, Express and MongoDB.
- Used AI-assisted and agentic coding workflows with Claude Code in daily development to build features, debug issues and ship faster.
- Collaborated with the team and helped manage releases from staging to production.

Frontend Intern

Grid Property Ventures | February 2026 - April 2026

- Built the GRID Mobile App using React Native.
- Collaborated with cross-functional teams on UI/UX.
- Adapted web workflows into mobile-friendly interfaces.

QA Intern

Grid Property Ventures | February 2026 - April 2026

- Wrote, executed and maintained manual test cases using Google Sheets/Docs.
- Identified, documented and tracked bugs and system errors.
- Coordinated and participated in UAT and Beta Testing sessions.
- Collaborated directly with developers to verify bug fixes.

PROJECTS

B.AI - Metro Manila Commute Assistant

Personal project, work in progress | https://github.com/Rav-alt/B.AI | Next.js 16, React 19, TypeScript, Tailwind CSS v4, Gemini API, Zod, Leaflet, Vitest, Playwright

- Building a mobile-first AI chatbot that tells commuters which jeepney, bus or train to ride between two places in Metro Manila.
- Built a data pipeline that turns the public GTFS transit feed into a compact route network (1,719 route patterns, 4,835 stops, 7,152 walking transfers), with a validated corrections file for outdated routes.
- Wrote a custom trip-planning engine in pure TypeScript that finds up to 3 diverse routes with at most 2 transfers and checks whether a given jeepney signboard goes to a destination.
- Integrated the Gemini API to understand questions in English and Filipino; the router decides the route and AI-written text is checked against the router result so the model can't invent routes, with model fallback on rate limits and a full no-AI mode.
- Added geocoding that resolves landmarks, stations and stop names first, then falls back to OpenStreetMap Nominatim with rate limiting and caching.
- Covered the system with 128 automated tests, built phase by phase with a documented workflow.

Who's That Pokémon? - Browser Guessing Game

Personal project, live | https://whothatpokemon.vercel.app | Next.js 16, React 19, TypeScript, Tailwind CSS v4, shadcn/ui, PokéAPI

- Built and deployed a Pokémon guessing game with three modes: Classic, Shadow Sprite and Higher or Lower.
- Classic mode shows each guess as a trading-card-style card and scores it against the answer on type, generation, evolution stage, colour, habitat and size, with hints showing how close each attribute is.
- Produced a 30-second promo trailer with an original synthesized chiptune soundtrack.

JhonRaven - Personal Portfolio

Personal project, live | https://jhonraven.vercel.app | Next.js 16 (App Router), React 19, TypeScript, Tailwind CSS v4, Radix UI, GitHub GraphQL API

- Designed and built a single-page portfolio with a scroll-driven hero: the name starts full-width and docks into a sticky profile column as you scroll (a slim top bar on phones).
- Shows real GitHub activity, fetched server-side from the GitHub GraphQL API and revalidated hourly.
- Built a token-based light/dark theme with a View Transitions switch, and kept it accessible: WCAG AA contrast in both themes, keyboard navigation, visible focus and a complete still page under reduced motion.

GRID Mobile App

Internship project, finished | React Native

- Co-developed a production-grade mobile app in React Native based on an existing web platform, collaborating equally with team members.
- Contributed to feature scoping, component development and mobile-friendly interface adaptation, improving usability through iterative testing.

Snap - Windows Workspace Launcher

Personal project, in development | Tauri 2, Rust, React, TypeScript, Tailwind CSS

- Building a Windows desktop utility that groups apps into workspaces and launches them all with one global keyboard shortcut from the system tray.
- React drives the UI while Rust commands handle native work: process launching, global hotkeys and Win32 window positioning.
- Features installed-app auto-detection, .exe icon extraction, Chrome profile and tab support, local JSON persistence and per-app error reporting.

KEY COMPETENCIES

Full-Stack Development • React & Next.js • TypeScript • Node.js & MongoDB • Platform Integration • Web Performance Optimization • AI/LLM Integration • Automated Testing • AI-Assisted Development • React Native • Git Version Control • Agile Collaboration • Figma

EDUCATION

Bachelor of Science in Computer Science

STI College, Pasay EDSA | 2022 - July 2026
